PGO1B Special Spacer

Making the Spacer

The spacer can be made of any rigid material that is at least $\frac{1}{16}$ " (2 mm). The size below is what is used in the video. Because the PGO1B Cutting Bar is 1.5 inches wide, the width of the spacer must be 1.5 or greater. It is important that the spacer be a rectangle. This means that the sides must parallel and the ends square.

If you make your spacer with window glass you will want to add masking tape to the edges. I dulled the glass edges with a file before I added the tape.
